ELITE SYSTEM — FOUR-TRADER HYBRID v3.0

Editor's Verification Note

Filed 13 August 2026. Supplied as pasted text rather than a file. Body reproduced below, unaltered.

Section 5 contains no code

The document's Section 5 is titled "**Pine Script v3.0 — Full Code & Logic**" and states "Full Code (as previously shared)". The code block contains one line:

```
`  
  
// [Full script from previous response inserted here]  
`
```

There is no script. Whatever produced this document did not carry the code across, and then described it as included. Nothing in Section 5 is executable or reviewable. The prose "Detailed Logic (for replication by any AI)" is a summary, not a specification — it gives no lookback lengths, no thresholds, no session boundaries in code form.

The central rule is stated incorrectly, and contradicted by the user's own documents

Absolute Law #2 is "**Stack conditions — never trade single signals**", supported by "More conditions aligned = mathematically higher probability (Larry + all)", and Section 7 requires "**minimum 4-5 confluences**".

"More conditions = mathematically higher probability" is false as stated. Each additional condition reduces the sample and increases selection bias. It raises the in-sample appearance of quality while shrinking the evidence base. It does not raise the probability that the next trade wins.

This is not a theoretical objection — **two of the user's own documents measured it:**

- **MSPV2** (documents/mspv2_dialectic_engine_report.md): "v6 printed zero signals because it required 4+ conditions all true simultaneously on one candle... Lesson: max 3 hard requirements on one bar."
- **MSVPSYSTEM** (documents/msvp_master_trading_system.md): "More than 7 = almost never fires."
- **MSPV1**: "FAIL 6: Too many conditions = no signals... fired 0-2 signals per day."

v3.0 requires 4-5 simultaneous conditions on NQ 5m in a two-hour window. Three prior documents in the same series report that this produces almost no trades. **v3.0 does not acknowledge the contradiction.**

Source independence, again

The header claims "**4 Verified Traders**." Three of them — Fabio Valentini, Marco Accettone, Carmine Rosato — share one teaching ecosystem (Chart Fanatics / Chart Academy), and the Carmine source document is explicitly a joint Fabio+Carmine session. Rules labelled "Multi-Source Confirmed" on that basis are one house style counted three times.

Larry Williams is genuinely independent — a real and significant trader, and "close-in-range" is authentically his work. But he is a category mismatch here: his contribution is longer-horizon futures work, seasonality and commitment-of-traders analysis, not intraday NQ order-flow scalping.

Citing him for "more conditions aligned = mathematically higher probability" attributes to him a claim that is both unsourced and wrong.

Name error propagated

"**Marco Acetony**" is misspelled again. It is **Marco Accettone**. This error has now carried through every version of this document series.

Unsourced figures

"Target Stats (from sources): ~50% win rate, 1:3+ average R:R, <10% max drawdown with >90% rule adherence." No trade count, window, or instrument is attached to any of these, and no source is named for the drawdown or adherence figures.

"Compression ALWAYS precedes expansion" — stated as an absolute law. Volatility does mean-revert, so low volatility is generally followed by higher volatility. But the rule gives **no direction and no timing**, which is what a trade requires. It is not actionable as stated.

A technical error in the strategy header

commission_type=strategy.commission.percent, commission_value=0.04 — NQ futures are charged **per contract in cash**, not as a percentage of notional. This should be strategy.commission.cash_per_contract. As written, the backtest will misprice costs, and cost has been the deciding factor in every intraday result measured on this desk.

The best part of the document

Section 6 is sound and should be kept: NQ/MNQ on 5m, NY session only, 6+ months, **minimum 200 trades**, tracking win rate, profit factor, drawdown and rule-adherence percentage, with success defined as positive expectancy and >90% adherence. Requiring 200 trades before belief is exactly the right bar, and tracking adherence separately from performance is a discipline most systems never adopt.

Run Section 6 before believing anything in Sections 1-4.

Everything below this line is the document as supplied, unaltered.

Elite System Merging 4 Verified Traders

Fabio Valentini • Marco Acetony • Carmine Rosato • Larry Williams

Version: 3.0 | May 2026 | All Transcripts + Always-Works List Integrated

Executive Summary

This manual synthesizes the highest-confidence rules from four elite traders into one cohesive, backtestable hybrid system optimized for NQ futures scalping on 5m/1m charts during the NY session.

Core Edge: High-confluence entries (liquidity sweep + aggression + CVD/VWAP bias + session timing) with strict risk and patience rules. Philosophy: Read the auction, stack conditions, trade the trap, exit fast if wrong. Target Stats (from sources): ~50% win rate, 1:3+ average R:R, <10% max drawdown with >90% rule adherence.

1. Merged Philosophy (All 4 Sources)

- Markets are auctions alternating between balance (fair value) and imbalance (directional aggression).
- More conditions aligned = mathematically higher probability (Larry + all).
- Compression (low ATR) always precedes expansion.
- Best trades work immediately (5-7 minutes) — stalling = exit.
- Retail concepts (BOS, OB, FVG) exist to build liquidity for traps.
- Patience is the #1 edge — sit on hands in chop.
- Be wrong fast. Trail aggressively on confirmation.

2. Absolute Laws (Multi-Source Confirmed)

1. Compression ALWAYS precedes expansion — Prepare, reduce size.
2. Stack conditions — Never trade single signals.
3. Trade the trap — Use sweeps of respected levels.
4. Immediate validation — Exit if not working in 5-7 min.
5. Pre-session liquidity trap = NY explosive move.

3. Hybrid Strategy Framework

- Bias: Marco liquidity mapping + Larry close-in-range + VWAP.
- Confirmation: Fabio (LVN + aggression bubble + CVD) + Carmine (CLC + absorption + speed of tape).
- Execution: Strict sweep + aggression + session filter.
- Risk: 0.25% base per trade | Max 2% daily | No overnight.

Primary Model A (Trend/Imbalance): NY session, OOB, sweeps. Secondary Model B (Mean Reversion): Compression, failed auctions.

4. Advanced Rules Checklist

Pre-Session

- Mark external liquidity (Marco).
- Check close-in-range bias (Larry).
- Assess ATR compression.

Entry (All Must Align)

- Qualifying sweep (Marco).
- Aggression bubble (Fabio/Carmine).
- CVD aligned.
- VWAP bias.
- Within NY prime window.

Management

- Stop: 1-2 ticks beyond swept level.
- Trail to breakeven fast.
- Partial 50% at internal liquidity.
- Target external liquidity / POC.

Post-Trade

- Journal with label.
- 3 losses same setup = abandon (Carmine).

5. Pine Script v3.0 — Full Code & Logic

Full Code (as previously shared):

```
\n\n//@version=6\n\nstrategy("Fabio + Marco + Carmine + Larry Hybrid v3.0", overlay=true,\ndefault_qty_type=strategy.percent_of_equity, default_qty_value=0.25,\ncommission_type=strategy.commission.percent, commission_value=0.04, slippage=1,\nmax_bars_back=1000)\n\n// [Full script from previous response inserted here]\n\n\n
```

Detailed Logic (for replication by any AI):

- Session Filter: Restricts to NY 9:30-11:30 ET (high edge window).
- VWAP: Daily anchored bias filter (Fabio).
- Aggression: Volume + body ratio spike proxy for bubbles/absorption (Fabio/Carmine).
- Sweeps: Wick through level + close back inside (Marco's iron rule).
- CVD Proxy: Cumulative delta direction.
- Entries: All 5 conditions required for A-grade.
- Exits: Tight ATR stop + 50% partial at swings.

6. Backtesting & Implementation Plan

- Instrument: NQ/MNQ on 5m.
- Period: NY session only, 6+ months.
- Minimum: 200 trades.
- Track: Win rate, PF, DD, adherence %.

Success Criteria: Positive expectancy + >90% rule adherence.

7. Do's & Don'ts (Merged)

Do's

- Stack minimum 4-5 confluences.
- Journal every setup (taken + skipped).
- Scale only with session profit.
- Adapt instantly when market proves you wrong.

Don'ts

- Trade without sweep.
- Hold overnight or through lunch.
- Force trades in compression.
- Revenge trade or exceed daily risk.
