FABIO VALENTINI — COMPLETE DETAILED TRAINING MANUAL

Editor's Verification Note

Added on filing, 13 August 2026. Body reproduced exactly as supplied. This is the first uploaded document checkable against PRIMARY SOURCE held in this repository — five Fabio Valentini transcripts in `trader_playbooks/sources/raw_transcripts/`. Verified against those, not the web.

Corroborated by the primary transcripts

Absorption — the manual makes it central ("heavy volume with no price follow-through = strong squeeze potential"). The transcripts use the concept **61 times**, in Fabio's own words: *"the sellers is huge but there is no followup... someone is absorbing this order", "this aggression at the moment is getting completely absorbed."* Fully corroborated.

CVD — corroborated verbatim: *"Volume, we can use one tool that is called CVD, that is cumulative volume delta"*, and used exactly as the manual describes, alongside VWAP standard deviations.

Balance/imbalance, LVN, read-don't-predict, no overnight holds — all present in the transcripts and in this repo's distilled `valentini_scalping.md`.

One precision LOST relative to the source

The manual says "filtered bubbles, 20-30+ contracts on 1m/5m." The transcript is unambiguous and more specific:

> *"For the five minutes and one minutes for New York session you can use 30
> contract as a filter. 30 contract, and during London session you can go with
> 20."*

It is **30 for New York, 20 for London** — a session-dependent threshold, not a "20-30" range. The companion MSVPSYSTEM document states this correctly; this one blurs it. Use 30/20 by session.

Cleaner than its companion documents

This manual contains **no fabricated statistics**. It does not repeat the misreported Initial Balance figures ("96.2% of NQ days", "82.17% single-side continuation") that MSVPSYSTEM attributes to the wrong instrument and sample. Its only quantitative claims — ~70% reversal probability at balance, 1:3 to 1:5 R:R, 0.25-0.5% risk — are stated as the trader's own framing rather than

dressed as independent research. That is the honest way to present testimony.

Title note

The header reads "FABIO VALENTINI (VALENTINA)". There is no evidence of a second name; "Valentina" appears to be an artifact.

Applicability

NASDAQ futures, New York session, on DeepCharts/ATAS/Sierra Chart. Middle of the night in Melbourne, different instrument, platforms this desk does not run.

Everything below this line is the document as supplied, unaltered.

Auction Market Theory + Order Flow Scalping System for NASDAQ Futures

Compiled from Full Transcript + Triple-Verified Research

Version: 1.0 - Exhaustive Edition

1. CORE MODEL / PHILOSOPHY (The Foundation - Never Skip This)

- **Auction Market Theory (AMT):** Markets are continuous auctions that alternate between **balance** (efficient trading at fair value, high volume areas) and **imbalance** (one side dominant and aggressive, seeking new equilibrium). Most of the time price is in balance. Big directional moves happen during imbalance.
- **Read, Don't Predict:** The #1 reason traders lose is trying to anticipate what the market "should" do. Only enter when the market clearly shows aggression + proper location.
- **Order Flow = Leading Information:** Price is lagging. Big order prints (bubbles), Cumulative Volume Delta (CVD), and absorption reveal real participant intent before price moves.
- **Volume Profile = The Map:** Shows Value Area, Point of Control (POC), and Low Volume Nodes (LVN). Always know where you are relative to volume distribution.
- **Objectivity Over Subjectivity:** Use clear filters (e.g. 20-30+ contract size) instead of subjective price action interpretation.
- **Dynamic Model vs Rigid Rules:** Market adapts daily. Treat it as a flexible model, not a cage of fixed rules.
- **Edge Decay:** Pure price action loses effectiveness when volatility changes. Order flow reads the underlying auction mechanics and adapts better.
- **Psychology Foundation:** No ego, no revenge trading. Stay out when conditions are not met. Focus on reading the auction, not P&L in the moment.

2. THE TWO CORE STRATEGIES

Model 1: Trend Following / Imbalance Model (Primary - New York Session)

Best Environment: High volatility New York session, directional days.

Step 1 - Market State:

- Price must be **out of balance** (breaking away from Value Area).
- Do NOT trade in balanced/choppy conditions with this model.

Step 2 - Location:

- Break of structure or major swing point.
- Align with **Low Volume Node (LVN)** from the impulse profile.
- Target reference: Previous balance area or POC.

Step 3 - Trigger (Aggression):

- Big aggressive orders (filtered bubbles, 20-30+ contracts on 1m/5m).
- Ideal: Pullback to LVN + strong aggression in imbalance direction.

Entry Rules:

- On aggression confirmation (prefer full 1-minute candle close).
- Can be aggressive (at breakout) or conservative (on retest).

Stop Loss:

- Tight, placed behind the aggressive order or recent swing.
- Sometimes 1-2 ticks below high to minimize slippage during acceleration.
- Rule: Be wrong immediately.

Target:

- Previous balance area / POC / Value Area.
- Usually take full profit (high probability of reversal at balance ~70%).

Risk-Reward: Typically 1:3 to 1:5. Can reach 1:10-20 on strong directional days.

Enhancement: Use CVD for early move to breakeven when divergence appears.

Model 2: Mean Reversion Model (London / Compression Days)

Best Environment: London session, summer chop, clear consolidation.

Market State:

- Balanced/consolidation (price respecting Value Area highs and lows).

Location:

- Deep discount (below Value Area) or premium.
- Target = high volume node / POC.

Entry:

- Wait for **first breakout**, then retracement back into balance.
- Confirm with big order absorption.
- NEVER take the first impulsive leg.

Stop Loss: Very tight. Wrong = immediate exit.

Target: Back into balance / POC area.

Purpose: Complements Model 1 for smoother equity curve.

3. UNIVERSAL RULES, DO'S & DON'Ts

Timing & Session Rules

- **Primary:** New York session only for Trend Model.
- Avoid first hour of London for trend following.
- Close ALL positions by end of NY session (no overnight).
- London/Compression: Use Mean Reversion Model.

Risk Management (Non-Negotiable)

- Per trade: 0.25% – 0.5% of account (up to 1% only after daily profit buffer).
- Max daily risk: ~2% (equivalent to 8-11 small stops).
- Build position size using daily profit ("house money").
- Move to breakeven aggressively on confirmation.
- Scale out on weakness or at targets.
- High trade count = fast drawdown recovery.

Execution & Trade Management

- Require full 1m candle confirmation to filter fakeouts.
- Filter big orders (20-30+ contracts).
- Use profile drawn on impulse swings for accurate LVN.
- Absorption (heavy volume with no price follow-through) = strong squeeze potential.
- Trail/adjust stops only when new aggression supports it.
- In strong trends: Selective trailing.
- In chop: Reduce size dramatically or stay out.

DO's

- Build profit consistently throughout the day.
- Adapt your narrative instantly when key levels break.
- Use both models together for balanced equity curve.
- Journal every trade with screenshots.
- Stay extremely patient in compression.
- Scale in on strong continuation (using profit only).

DON'Ts

- Do not predict or anticipate moves.
- Do not revenge trade or force setups.
- Do not hold positions overnight.
- Do not take the first impulsive move in reversion setups.
- Do not marry your bias — change when market proves you wrong.
- Do not exceed daily risk limit.
- Do not ignore session-specific behavior.
- Do not use wide stops hoping for reversal.

When to Stay Completely Out

- Pure compression without clear imbalance.

- No aggression + no LVN alignment.
- Pre-market / pre-NY open noise.
- After hitting daily risk limit.
- Unclear auction direction.

4. TOOLS & PRACTICAL IMPLEMENTATION

Professional Platforms (Recommended for Real Edge):

- DeepCharts
- ATAS
- Sierra Chart

TradingView Approximations (Good for Practice):

- "Fabio Valentini Pro Scalper [PickMyTrade]"
- "Fabio-Style Order Flow System by SaaETH"
- AMT Institutional Model v2

Key Visuals to Master:

- Volume Profile (Session + Composite)
- Cumulative Volume Delta (CVD)
- Filtered Big Order Bubbles
- Low Volume Nodes
- Absorption patterns

5. HIGHEST PROBABILITY CONFLUENCES (Triple-A Core)

1. **Imbalance + LVN + Aggression** (Strongest)
2. **Absorption at key profile levels → Squeeze setup**
3. **CVD confirmation + proper session timing**
4. **Full candle close + big order follow-through**

6. PSYCHOLOGY & LONG-TERM SUCCESS

- Transparency with losses builds real discipline.
- High trade volume (scalping) allows statistical edge to shine.
- Focus on capital protection above all.
- Ego is the biggest account killer.
- Build size gradually with proven consistency.

End of Manual

This document contains every single detail extracted from the original transcript, verified external sources, and our complete conversation history. Use it as the master reference for training.
