Don't think about what can happen in a month

Don't think about what might happen in a year

Focus on the coming 24 hours and do what you know is right when it comes to improving by 1%!

Growth will come. Be patient!

! "Up or down" is not a question I can answer 24/7, I need to see certain patterns forming in price to be able to predict - I used to go weeks without trading. Why? I won't touch the market until I see an obvious trade. I refuse to force things.

DAYE.

Quarterly Theory

| what it is

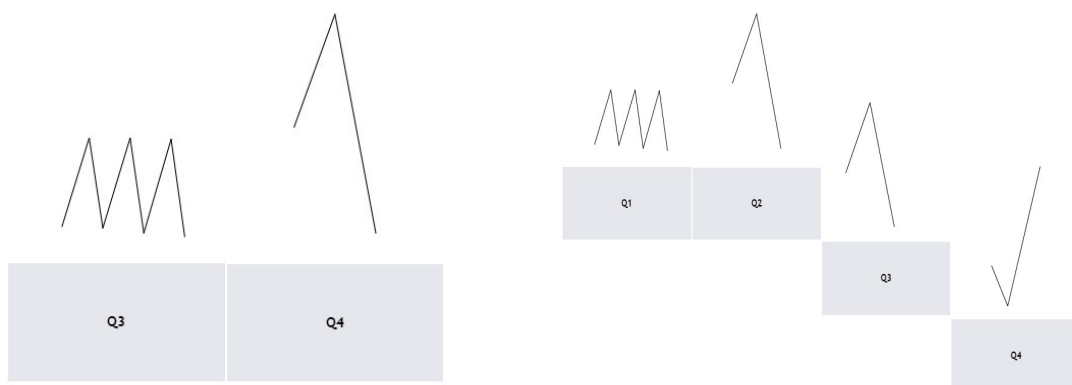

QT - theory created by the famous Western trader DAYE

The session, day, week, month and year consist of 4 quarters of time related to price, which can be considered as fractal phases of the market.

Time - Quarters | Price - Consolidation/Expansion

You have the ability to assume the price phase in the next Q based on the past Q. For example : if your any Q is consolidating, then expect expansion in the next Q OR if your Q is aggressively expanding, then we can assume that the next Q will be either low probability or CONSOLIDATION.

These "Q's" can also be your intra-day sessions, like Asia or London.

- Asia consolidates, trade London, skip New York, then trade PM-session.
- Asia will expand, skip London, trade NY and skip the PM session.

Its Simple :)

A little time table

	Q1 (A O)	Q2 (M H/L)	Q3 (D L/H)	Q4 (C)
Year	Jan-Apr	Apr-May (1 apr = true year open)	May-nov	Dec resets yearly range
Month	Wk 1 (full week)*	Week 2 (2nd mon = True month open)	Wk 3	Wk 4
Week	Mon	Tue (Monday 6pm = true week open)	Wed	Thu
Day	Asia (6-12am)	LO (12-6am)	NY (6am-12pm)/PM (12-6pm)	LC
Intraday (M90)				
Asia KZ	18.00 - 19.30	19.30 - 21.00	21.00 - 22.30	22.30 - 00.00
LO	00.00 - 01.30	01.30 - 03.00	03.00 - 04.30	04.30 - 06.00
NY	06.00 - 07.30	07.30 - 09.00	09.00 - 10.30	10.30 - 12.00
PM	12.00 - 13.30	13.30 - 15.00	15.00 - 16.3	16.30 - 18.00

Dedication in true opens

True Opens - что это такое?

**True Open - this is your "thermometer."**
Price trades above it, you sell.
The price trades below it, you buy.

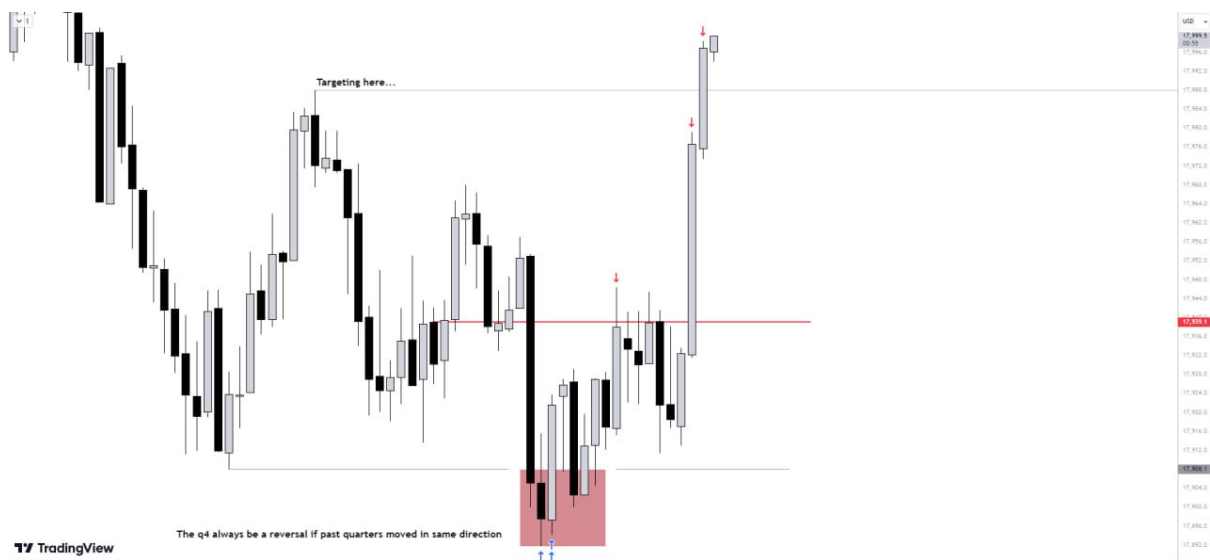

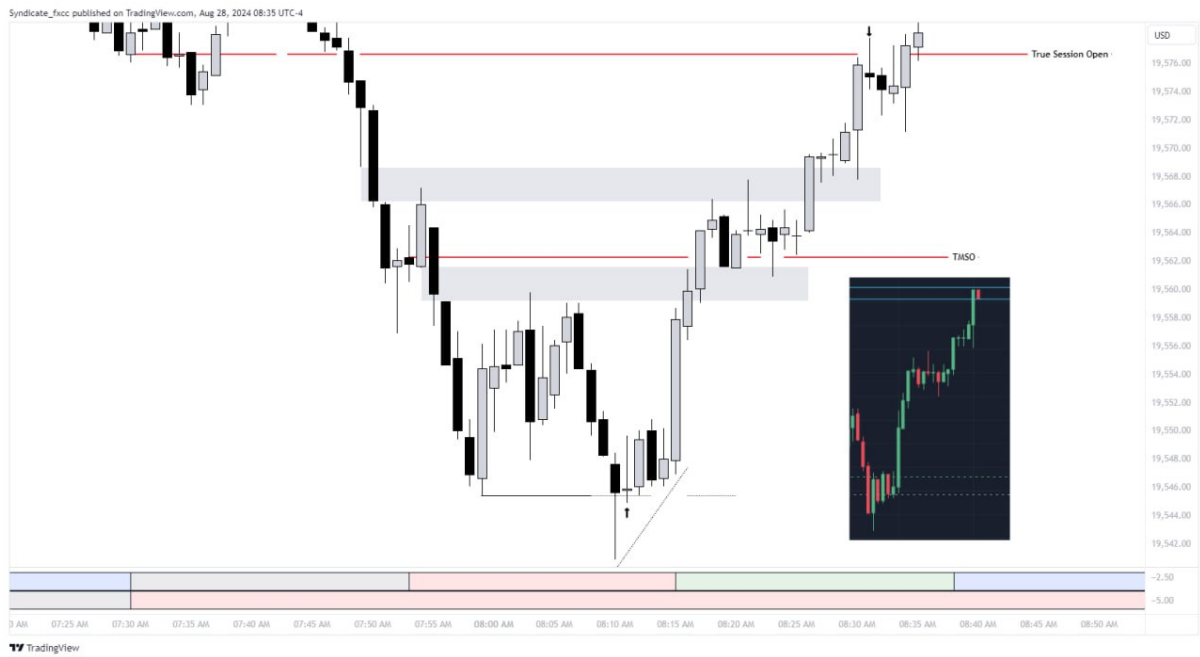

A lot of people think True Open is only about opening Q2, I'll tell you that's not true!

Every Q has a property to open -> every Q opening is a True Open.

A bit of examples with T.O's work below :

Mechanic's charts

MODEL.

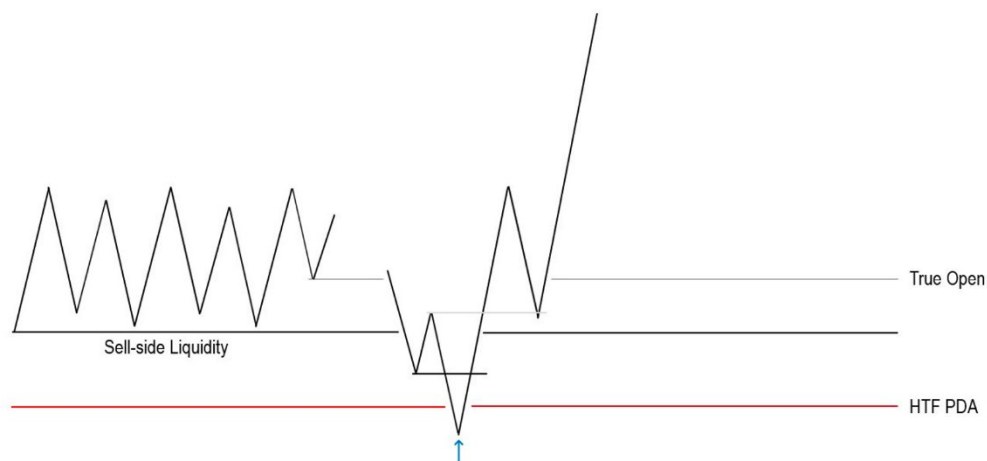

Complete trading model in five sentences

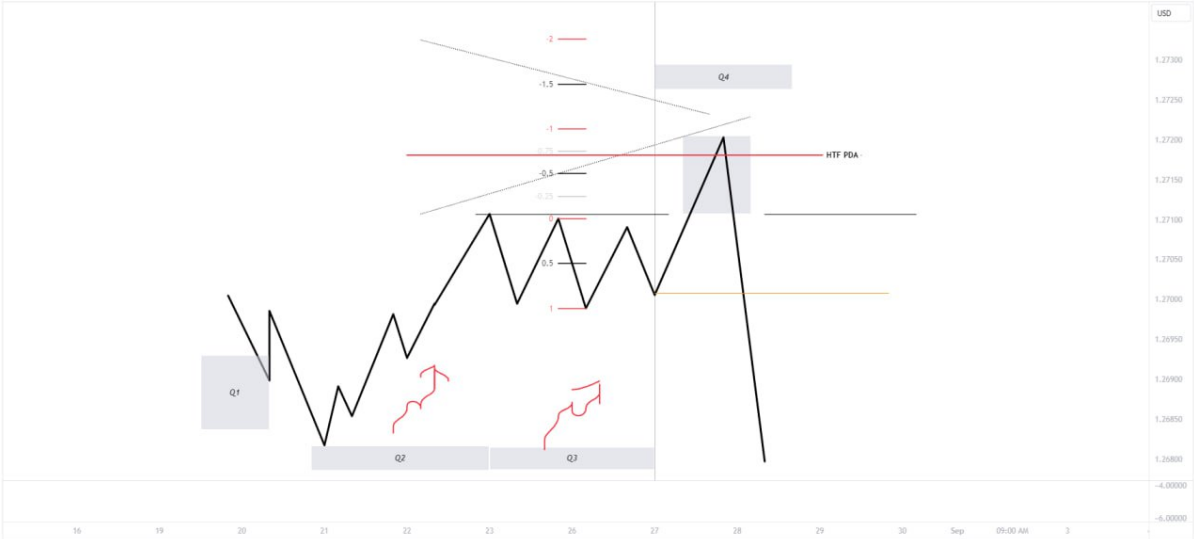

! Past Q MUST be low probability (consolidation)
Price MUST trade during a KZ
Price MUST trade above True Open if you are targeting a short position, or below True Open if you are set up for a long position.
The price MUST touch the PDArray of a higher timeframe for example
If you are trading 1min, you need a 15min HTF PDA (OB, FVG, LIQUIDITY, OLD HIGH\LOW ETC.).

- 1 min → 15 min
- 5 min → 1h
- 15 min → 4h

I'll show a couple examples of the model itself below.

[Model.](#)

Trade Examples

! Below I will show you examples of mine and DAYE's trades

Trades Examples

PSP | Precision swing point

Intro to PSP

! PSP | Precision swing point - что это?

Let's start simple, for all those who don't understand, a PSP (pinpoint swing point), is simply a candlestick pattern that forms before a sequential SMT (SSMT)

In most cases, a PSP can only be formed when this formation “does not correlate with an asset triad”, for example, if a bullish swing low is formed on NQ, then a bearish swing low should be formed on ES or YM.

This “pattern” is a bullish swing low or bearish swing high formation..... that's all, the importance of this pattern depends on the criteria.

Therefore, we will not call every bullish low a PSP, and vice versa; only those formed after the creation of a sequential SMT (SSMT), which allows us to engage the time factor and activate the sequence in which algorithmic pricing is forced to operate.

Nonetheless, sequential SMT(SSMT) is not all that is required to validate a PSP. Reserving algorithms are implemented through correlation in time frames to ensure efficient and balanced reserving of an asset or security.

! It is the same with PSP, since you have different timeframes in which a PSP can form, you will also have to associate that timeframe with its starting element of the sequential SMT(SSMT). This means that every true formation of a sequential SMT(SSMT) is associated with the PSP of the correlating timeframe.

Such timeframes are:

Monthly SSMT - 4h PSP

- Weekly SSMT - 1h PSP
- Daily SSMT - 15m PSP
- 90m (Sessional) SSMT - 5m PSP
- Micro SSMT - 1m PSP

The most common format for entering a PSP is the closing candle. This means that you will open your position on the close of the candle of the correct PSP timeframe that is associated with the present sequential SMT(SSMT). Very similar to how to properly use iFVG.

! This is an introduction to how we can use time synchronization for timed entry. There are quite a few forms of entry for PSP, but this one is by far the safest and extremely effective for getting above-average RR.

This is roughly what the PSP looks like, marked with a gray rectangle.

M5:

M1:

SSMT(sequential smt)

! SSMT (последовательное SMT) что это?

This is an SMT that takes place between Qs. What is its essence?

As my observations show SSMT is a high probability variation of any smt that may occur in the market. Why? It's all about TIME.

As we said earlier : Reserving algorithms are performed through correlation in time frames, which ensures an efficient and balanced reserving of an asset or security.

EXAMPLES
